

## Modern Encryption Standard version V: (MES-V)

Asoke Nath<sup>1</sup>, Bidhusundar Samanta<sup>2</sup>

### Abstract

*In this paper the authors have introduced a new symmetric encryption method named as Modern Encryption System Standard Version V. The system is basically an extension of MES I,II,III & IV and Bit level Encryption Standard(BLES)-II & III. MES-I,II,III mostly based on byte level encryption method. BLES-I,II,III are based on mostly bit level encryption methods. Here mainly three different module of encryption have used. Those methods are Modified Generalized Vernam Cipher Method with feedback, Bit level Generalized Modified vernam cipher method with feedback, and Bit wise XOR operation. The Modified Generalized Vernam Cipher Method is the Byte level method and this is a block cipher method. Here 'Feedback' of each character is used for the encryption of the next character. In the Bit level Generalized Modified Vernam Cipher Method with Feedback key used is the same length as the input file. The key is essentially a stream of bits. This method is used multiple times in both ways from left to right and then from right to left. In the Bit wise XOR operation, bit wise XOR operation performed with bit-1 with bit-n(last bit) and substituted in the position n and bit-2 with bit-n-2 and substituted in position n-2. The present method applies multiple encryption and multiple decryption. From the entered key string the randomization number and encryption number are calculated using a method proposed by Nath et al. This present method will be used for encrypting short message, password, bank data, and other confidential data. This method is free from brute force attack, plain text attack or differential attack.*

### Keywords

*Plain text, Cipher text, Randomization, Bit level encryption, Feedback*

### 1. Introduction

In this age of universal electronic connectivity, of viruses and hackers, of electronic eavesdropping and electronic fraud it is a big challenge for a sender to send confidential data from one place to another through network. The confidential data cannot be sent from one computer to another computer as the intruder and hacker can intercept the data. The Hackers have created various crack software. Using that software anyone can break any password and can log into any confidential site. All these are happening because of free network access. Network access is now free to anyone. So when a user is working in a network environment then the user must be very careful about his/her confidential data. Any kind of private data should not be sent in raw form from one computer to another. The private/confidential data must be encrypted first and then it should be sent over the internet. Otherwise anytime the disaster may come. To overcome this problem one has to send the encrypted text or cipher text form client to server or to another client instead of sending in unencrypted form.

Cryptography and cryptanalysis is now a very important research area in modern digital communication network. Nowadays network security and cryptography is an emerging research area where the programmers are constantly trying to develop some strong encryption algorithm so that the confidential data when encrypted remain secret from the attacks of hackers and intruders.

The cryptography methods can be divided into two categories: (i) symmetric key cryptography where one key is used for both encryptions and decryption purpose. (ii) Public key cryptography where two different keys are used one for encryption and the other for decryption purpose. In symmetric key we have to maintain only one key and hence the key management is simple. In public key cryptography we maintain two keys one is public key which is known to everybody and that can be used for encryption purpose and there is another key called private key which is kept secret key and that is used for decryption purpose only. The main advantage of symmetric key cryptography is that the key

management is very simple as one key is used for both encryption as well as for decryption purpose. In this method the key is called secret key and it should be known to sender and receiver both.

The present method is a symmetric key cryptographic method which is introduced as The Modern Encryption Standard Version V. This is an upgraded version of earlier version developed by Nath et al. Recently Nath et al developed cryptography method called Modern Encryption Standard version-I and Modern Encryption Standard version-II. and Modern Encryption Standard version-III.

The present The Modern Encryption Standard Version V uses three different encryption method such as modified generalized byte level Vernam cipher method with feedback, bit level generalized modified vernam cipher method with feedback, and bitwise xor encryption method. In this version both bit level and byte level encryption method are applied to develop more secure encryption. In both byte and bit level of vernam cipher method feedback from previous encryption is used for next encryption which results in more potent encryption and in both cases the key used is taken from the randomized array. The keygen() function is called at the start of the encryption which generate the encryption number and the randomization number. The output shows that the encryption is very strong as the encrypted text is totally different .The present method applied on repeated pattern but the output contains totally different pattern. This method is useful for encryption of different text, password, defense data, bank data etc.

## 2. Algorithm bitwise vernam cipher with feedback encryption function:vernamenc(file f1 file f2)

```

step 1 : set ch1=0
step 2 : set n2=0
step 3 : set i=0
step 4 : if i>=16 go to step 11
step 5 : set j=0
step 6 : if j>=16 go to step 10
step 7 : set mat[i][j]=n2
step 8 : set n2=n2+1
step 9 : set j=j+1 and go to step 6
step 10 : set i=i+1 and go to step 4
step 11 : call randomization()
step 12 : n2=0
step 13 : set i=0
step 14 : if i>=16 go to step 21
step 15 : set j=0

```

```

step 16 : if j>=16 go to step 20
step 17 : set key[n2]=mat[i][j]
step 18 : set n2=n2+1
step 19 : set j=j+1 and go to step 16
step 20 : set i=i+1 and go to step 14
step 21 : open file f1 in read mode
step 22 : open file f2 in write mode
step 23 : set times3=1
step 24 : set pass=1
step 25 : read first 256 character from file f1
           and assign it to array a[256] and
           assign the number of character read
           to n
step 26 : if n!=256 go to step 51
step 27 : set i=0
step 28 : if i>=n go to step 31
step 29 : set str[i]=a[i] // str[256] is an array
step 30 : set i=i+1 and goto step 28
step 31 : call encryption(str,n)
step 32 : read first 256 character from file f1
           and assign it to array a[256] and
           assign the number of character read
           to n
step 33 : if pass=1 set times=(times +
           times3*11)%64 and increase pass
           by 1
step 34 : if pass=2 set times=(times +
           times3*3)%64 and increase pass by
           1
step 35 : if pass=3 set times=(times +
           times3*7)%64 and increase pass by
           1
step 36 : if pass=4 set times=(times +
           times3*13)%64 and increase pass
           by 1
step 37 : if pass=5 set times=(times +
           times3*times3)%64 and increase
           pass by 1
step 38 : if pass=6 set times=(times +
           times3*times3*times3)%64 and set
           pass=1
step 39 : increase times3 by 1
step 40 : call randomization()
step 41 : set n2=0
step 42 : set i=0
step 43 : if i>=16 go to step 50
step 44 : set j=0
step 45 : if j>=16 go to step 49
step 46 : set key[n2]=mat[i][j]
step 47 : increase n2 by 1
step 48 : set j=j+1 and go to step 45
step 49 : set i=i+1 and go to step 43
step 50 : go to step 26

```

```

step 51 : set i=0
step 52 : if i>=n go to step 55
step 53 : str[i]=a[i]
step 54 : set i=i+1 and go to step 52
step 55 : call encryption(str,n)
step 56 : close all files

```

**bitwise vernam encryption with  
feedback:vernambitenc(file  
input,file output)**

```

step 1 : set k=0
step 2 : set i=0
step 3 : if i>=16 go to step 10
step 4 : set j=0
step 5 : if j>=16 go to step 9
step 6 : set mat[i][j]=k
step 7 : increase k by 1
step 8 : increase j by 1 and go to step 5
step 9 : set i=i+1 and go to step 3
step 10 : call randomization()
step 11 : set i=j=0
step 12 : set cr1=0

step 137 : write add to file output file
step 138 : go to step 117
step 139 : close all files
step 140 : stop

```

**Bit wise XOR encryption  
function:bitxorenc(file f1,file f2)**

This function takes two files f1 and f2 as argument

```

step 1 : Open the file f1 in read mode
step 2 : Open the file f2 in write mode
step 3 : set l=size of file f1
step 4 : set n1=l/32
step 5 : set n1=l%32 // a%b returns the remainder
          after dividing a by b
step 6 : Go to the start of file f1
step 7 : set i=0 and n=0
step 8 : set j=0
step 9 : set mat[i][j]=n
step 10 : set n=n+1
step 11 : Set j=j + 1 and if j<16 go to step 9
step 12 : set i=i+1 and if i<16 go to step 8
step 13 : set i=1
step 14 : if i>secure then go to step 17
step 15 : call randomization()
step 16 : set i=i+1 and go to step 14
step 17 : set i=1
step 18 : if i>n1 then go to step 23
step 19 : Read next 32 character from file f1 and
          assign it to array data1[32]
step 20 : Call bit_stream(data1[32])
step 21 : Call encrypt_bit()
step 22 : set i=i+1 go to step 18
step 23 : if n2=0 go to step 30
step 24 : set i=0
step 25 : if i>=n2 go to step 30
step 26 : Read next character from file f1 and assign
          to data2[i] of array data2[32]
step 27 : set data2[i]=rshift_residual(data2[i],5)
step 28 : write data2[i] to file f2
step 29 : set i=i+1 go to step 25
step 30 : close all files

```

**bitwise vernam cipher with feedback  
decryption function:vernamdec(file f1  
file f2)**

This algorithm is reverse of vernamenc algorithm

**bitwise vernam decryption with feedback:vernambitdec(file input,file output)**

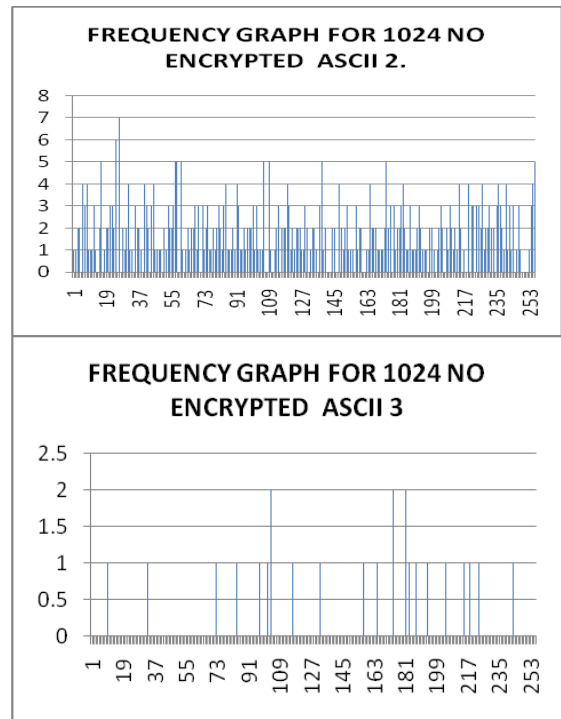

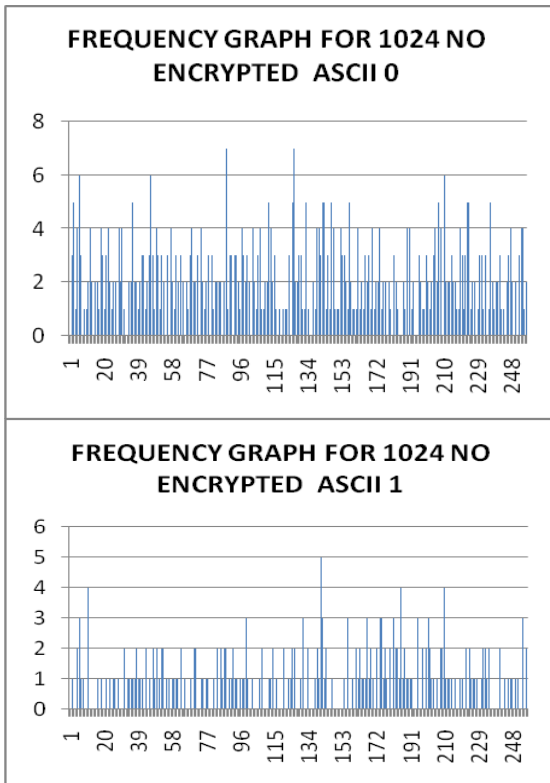

This algorithm is reverse of vernambitenc algorithm

**bitwise xor decryption function:bitxordec(file f1,file f2)**

This algorithm is reverse of bitxorenc algorithm

**3. Results and Discussion**

The MES-V(Modern Encryption Standard version V) applied on different type of text files. For example this method when applied to a text containing 1024 numbers of ASCII 0 gives encrypted characters of different types which is shown in the graph below. Also shown the graphs of other encrypted ASCII characters below.

**Fig 1: Frequency Graph of Different ASCII codes**

This encryption method applied to different type of text/patterns and shown below are the pairs of such different type of patterns and the corresponding cipher text.

**Table-1: Some original text and Encrypted Text**

Sl. No.	Original Text	Encrypted Text

### 4. Conclusion

The MES-V is built up on both bit level and byte level encryption method. The method is absolutely strong against any type of attack such as known plain text attack or differential attack or brute force attack. Though only the component encryption modules are applied here for once, multiple level of application will yield much more stronger technique and more potential against any type of cryptographic attack. The encrypted text cannot be decrypted without knowing the random matrix. The spectral analysis shows the diversity of encrypted characters even when the input plain text characters are of same type. The same text except a different character at any position gives quite different cipher text under the same encryption key. This method is applicable for encryption of short messages, secret data, financial data, defense data, as well as applicable for large text encryption also.

### Acknowledgement

We are very much grateful to Indira Gandhi National Open University(IGNOU) and Department Of Computer Science, St Xaviers College to give us such opportunity to work on symmetric key cryptography.
